

Greenhouse Gas Inventory

The Greenhouse Gas Inventory aims for the company self-knowledge under the perspective of climate change. This is the first step for companies seeking to implement a carbon emissions management.

In the inventory, emission sources and their respective gases are mapped, allowing the identification and evaluation of the main activities that contribute to greenhouse gas (GHG) emissions, in addition to other gases such as those established by the Montreal Protocol.

EBP Brasil offers this service and can also assist companies during the declaration phase of emissions in information disclosure programs, as well as technical support during third-party verification or engagement in international programs. It also acts in the other faces of carbon management, such as Carbon Footprint of Products and Services, Mitigation Plans and Adaptation to Climate Change, with interaction with the other offices of EBP to add international knowledge and experience in our projects.
